WHY USE THE POSTERIOR?

- Allows us to use probability in more contexts.

- $P(\theta \mid y)$ represents our knowledge of parameters using probability.

- this representation fully encapsulates our beliefs.

- $P(\theta)$, the prior, can encode useful information.

- parameter scale, shared structure, permitted values…

- Isn't the MLE the best estimator? (depends on the criteria...)

- Sometimes... but not $\rho = f(\hat{\theta})$

- Expands the range of models we can fit
