

LET'S GET RID OF THESE POSTERIOR CORRELATIONS

$$y = a + \beta x$$

Scaling to unit variance

• Centering both x and y values

Scaling and shifting parameters can help

with convergence

$$\tilde{y}_i = y_i - \bar{y}$$

$$\tilde{x}_i = \frac{x_i - \bar{x}}{sd(x)}$$

#Model

significantly(1),

```
iter=1000, chains=4, cores=4)
```

data = list()

$y \sim \text{normal}(\mu, \sigma^2)$,

$$a \sim \text{normal}(0, 1),$$

ulam(alist)

$$\text{mean}_x = \text{mean}(d2\$weight)$$

`mean_y == mean(d2$height)`

$y = d_2 \$height - mean_y,$

$$x = (d2\$weight - mean_x) / sd_x;$$

$mu < -a + b * x,$

#Pre-atalante means and sds

$$\text{std_x} = \text{std}(\text{d2\$weight})$$

$$b \sim \text{lognormal}(0, 1),$$

a = 0
